

*Juglans regia 30-35cm*

*Juglans regia* is a medium-sized, broad crowned deciduous tree.

Their medium green leaves which appear in late spring / early summer are pinnate with 5-7 large oblong leaflets, aromatic when bruised they tend to fall between October to November

In April/May yellow/green male catkins of up to 10cm in length appear from auxiliary buds, the female flowers are smaller, inconspicuous green and globose appearing on the same tree at the tips of the branches.

Fruits are green and globose, around 5cm in width, and contain an edible nut.

The bark is initially silver grey and smooth, grey-brown to blackish brown and deeply fissured later on.

*Standard 30-35 Juglans regia in Autumn*

## Plant Profile

<b>Name:</b>	<i>Juglans regia</i>
<b>Common Name:</b>	Common Walnut
<b>Family:</b>	Juglandaceae
<b>Height:</b>	Above 15 metres
<b>Width:</b>	Over 10 metres
<b>Demands:</b>	Prefers full sun, in either sheltered or exposed settings
<b>Soil:</b>	Any well drained soils
<b>Foliage:</b>	Deciduous
<b>Fruits:</b>	5cm green and globose with edible nuts

#### Deepdale

The distinguishing feature that separates *Juglans* from other pinnate leaved trees is that if the shoot is cut along its length, the pith can be seen to be divided into compartments which resemble the rungs of a ladder.

*Juglans regia* 40-45cm container grown

*Juglans regia* multi stem 2.5 - 3m

*Juglans regia* 30-35cm in winter
