

Tilia x euchlora

Caucasian lime / Crimean Lime

Tilia euchlora standard 50-60

The *Tilia x euchlora* is an unmistakable large deciduous tree with spreading or arching branches and green young shoots bearing deep green heart shaped leaves, a character of the lime, which turn yellow in autumn.

The intoxicatingly fragrant creamy yellow drooping flowers appear in clusters of 3-8 in mid summer. Whilst it can grow to be quite large it is a tough and tolerant tree which enables it to be a perfect addition to a planting scheme or avenue.

The foliage due to its dark green colour does not suffer from aphid infestations which means you do not get the black fungus-infested honeydew which makes a mess on urban pavements and parked cars usually associated with an infestation.

Plant Profile

Name:	<i>Tilia x euchlora</i>
Common Name:	Caucasian lime, Crimean lime
Family:	Malvaceae
Height:	higher than 15 metres
Width:	wider than 8 metres
Demands:	Full Sun, / partial shade
Soil:	Chalk, Loam, Sand, and Clay
